Connectors weekly review

Tuesday, November 10, 2026 — the week judged is the seven days ending today, November 4 to November 10. Every judgment rests on a named record from that week — a dated log, a verify line, or a dated note in the daily record — never on an impression. This review changes nothing: it connects nothing, edits no job, and switches nothing. Anything it suggests is a proposal, waiting on your word.

15 connectors in use — 12 working well, 0 working poorly, 3 with no record this week.

Needs your eye

No connector is working poorly this week.

How it applies to you: nothing in use stands failed or incomplete at the week's end. The one rough morning — the GitHub rate limit on November 9 — healed the same day, and the full lines stand below.

Proposal — a possible answer to your Samsung Health question, with phone steps ready.

How it applies to you: Samsung's own developer table lists blood pressure and blood oxygen as kinds that do sync from Samsung Health to Health Connect, each under its own permission, and this week's research found the same answer again in a fresh source. The full research and the steps for your Galaxy Z Fold5 stand in the open-questions section at the end. Trying the steps waits on your word — nothing on your phone was changed. If you say go, the work set in motion is: you tap through the steps on your phone, and the next health check reads whether those two kinds now stand in Health Connect.

Standing watch — no new connector this week gives an AI agent access to Amazon, or to another retailer that blocks AI access.

How it applies to you: the week's one new connector is Uber Courier, a package-delivery booking road. It opens no retailer at all, so there is no find to flag under this watch.

No better connector is proposed for any job this week — the close comparisons stand later in this report, so you can see the looking was real.

One new connector arrived this week — Uber Courier, in the daily catalog snapshot for November 10, 2026. It is judged little use to you, so it is not named as a fit; its line stands later in this report.

The week, connector by connector

GitHub — your key road (custom) — Working well — the Scroll chain verify logs end PASS every day, November 4 through November 10, 2026 (the latest is the verify log for November 10, 2026, timed 03:55), and the morning KPI record for the night of November 10, 2026 marks all eight night runs PASS. Two exceptions, named: (1) on November 9 the Scroll chain stopped that morning on a GitHub 403 rate limit and the edition published later the same day — verify log for November 9, 2026, timed 10:57, ends PASS; the hearth publish check for November 9 ends UNKNOWN for the same limit and reads MATCH again on November 10; (2) the github-publish log for November 10 holds three FAIL lines, at 1:07 PM, 2:02 PM, and 4:06 PM, each saying its sending key was not set in that run — while the same day's publishes through your key road end PASS in the daily record for November 10, and the tools and systems check for November 10, at 7:41 PM, reads the publishing check for the morning-scroll repository as PASS.

Facebook — Working well — the yard and estate sales refresh logs end with a final PASS every day, November 4 through November 10, 2026 (yard-estate-sales-refresh logs), and the maker finds watch ran 19 Facebook Marketplace searches on November 4, 2026 (daily record, November 4), with its November 8 and 9 rounds reporting no true fit in the completion record read on November 10.

Gmail — Working well — the GitHub failure-letter watch searched Gmail every day this week, and its post-publish checks on November 10, 2026 end PASS with no failure letter found (github-letter-watch post-publish checks log, November 10); the Amazon subscription cancellation letter was read from Gmail itself on November 4, 2026 (daily record, November 4).

Google Calendar — Working well — the morning briefing read your calendar in full on November 4, 2026 (the Audible renewal note and the Seabrook sunrise entry — daily record, November 4), the briefing run in the morning KPI record for the night of November 10, 2026 ends PASS, and the December 22, 2026 cancellation item was verified live on your calendar in the November 7–8 prep record.

Google Contacts — Working well — a contact for Muggy, with the address muggy@muse.ai, was created in your Google Contacts and read back verified on November 7, 2026 (daily record, November 7). One exception, named: the first add that evening met a 403 error; after the connector was reconnected, the add succeeded and was read back the same evening.

Google Docs — Working well — three Google Docs were built and read back this week: the cancellation prep (read back with all four parts present), the Failed Jobs Record (read back, title plus four numbered sections), and the Early Filament Buy List (read back, 33 paragraphs) — daily record, November 7 and 8, 2026.

Google Drive — Working well — the family-photo access count logs end PASS every day, November 4 through November 10, 2026, each searching the Drive folder “Family Photo Sign-in Records” (family-photo-access-count logs), and your home insurance policy declarations were read from Drive on November 4, 2026 (daily record, November 4).

Health Connect — Working well — the daily walk watch ends Gate 139: PASS in the morning KPI record for the night of November 10, 2026, and the health sync check at 7:31 PM on November 10, 2026 reads November 9 now complete in Health Connect (steps 4,452, heart average 58.8, main-night sleep 6 hours 30 minutes — daily record, November 10). One exception, named: November 9 stood as a 12-step fragment through most of November 10 before it landed that evening — the lag is the phone-side sending, and this connector read the day in full once it landed.

Google Sheets — Working well — the supplement comparison sheet was built in Google Sheets on November 7, 2026 and edited and read back on November 8, 2026, with the extra line and section gone, as you ordered (daily record, November 7 and 8).

Google Tasks — Working well — the morning briefing read your tasks in full on November 4, 2026: 17 ready tasks, 8 overdue (daily record, November 4).

Shopping search (Meta Catalog) — Working well — a fresh catalog search on November 4, 2026 saved 50 results behind the supplement product checks (daily record, November 4), the same search road stood behind the product checks on November 7 and 8, and the price-drop watch run for November 10, 2026 stands in its own run log.

Places Search — Working well — the chimney and pellet stove comparison delivered on November 8, 2026 was built through it: three Payson businesses with addresses, phone numbers, and ratings read and ranked (daily record, November 8).

Shop Pay — No record this week — no checkout in the week's logged work used your Shop Pay wallet; it is only ever used with your approval at a checkout.

Link by Stripe — No record this week — no checkout in the week's logged work used your Link wallet; it is only ever used with your approval at a checkout.

vidIQ — No record this week — no video research was run in the week's logged work. Named plainly: a check on November 10, 2026 confirmed the connection stands and that its tools include a transcript tool for a named video, and no transcript was pulled in that check (daily record, November 10).

The close comparisons — why no switch is proposed

Publishing: GitHub (the system one) against your key road. The system one works through GitHub's own official server and would need the Muse app installed on each repository before it could touch it; your key road publishes every night and raises no approval cards. This week's rough morning was a GitHub rate limit, not a wrong road, and it healed the same day. No edge for the system one.

Health: Apple Health and Withings against Health Connect. Apple Health reads an iPhone only; your phone and watch are Samsung. Withings reads Withings gear; your record shows none, and you settled Samsung only. Health Connect stays the only road to your Samsung record. No edge.

Mail: Outlook Mail and IMAP Email against Gmail. Both read other mailboxes — Outlook Mail reads Microsoft mailboxes, and IMAP Email only reads and cannot send or draft — and your mail is Gmail, which was read and searched all week. No edge.

Files and notes: Box, Dropbox, and Notion against Google Drive and Google Docs. Each works in its own account or workspace; your files and notes live in Drive and Docs, which read and wrote all week. No edge.

Tasks: Todoist and Asana against Google Tasks. Todoist is a second to-do app and Asana runs a team's boards; your lists live in Google Tasks and were read in full this week. No edge.

Shopping and paying: Shopify checkout (UCP) against Shopping search, and no wallet against your two wallets. The Shopify road only checks out finds from Shopify stores; your shopping checks run across many stores through Shopping search, and your buys run at Amazon and Walmart. Shop Pay and Link had no checkout this week to judge a switch on. No edge.

Places and video: no other connector in the catalog does Places Search's business lookups, and no other one does vidIQ's YouTube research. No candidate stands to compare.

Delivery: Uber Courier, the week's new connector, was also compared against the work in use. It books a local courier for a package; no job in your standing work sends packages that way, so it is not a better road for any job the in-use connectors serve. No edge.

New connectors this week

The daily catalog snapshots dated November 6, 7, 8, 9, and 10, 2026 were read. The first four each carry an empty new list. The November 10 snapshot lists one new connector:

Uber Courier — Little use to you: it books a local Uber courier to pick up and deliver a package that is already paid for and under $200, with quotes, tracking, and cancelling (its own record, read in full for this review). You have no standing need to rush packages around Payson, and whether Uber Courier runs in Payson at all is a guess.

> How it applies to you: nothing in your week's work sent a package by courier, and no job it could serve stands open. It gives no access to Amazon or to any retailer, so the standing watch names nothing here.

Ideas from outside — how other people use these connectors

Source note: read from public community talk this week — public guides and community pages that gather what Muse users report, named with each idea. Reddit was tried first: searches for Muse community talk about these connectors returned no Reddit posts that could be read, and no Reddit page was read directly — Reddit stands named as unread this week, and nothing below rests on it. Your personal Reddit account was never used, and nothing was posted anywhere. Only ideas tied to a concrete use in your life were kept; the rest were read and dropped. Every idea is a proposal only — nothing was connected and nothing was changed.

Google Calendar + Gmail — one line of mail behind each event.

What others do: the Built with Muse guide to the Google Calendar connector (updated October 25, 2026) describes users pairing Calendar with Gmail so the briefing carries what the event is really for — the mail behind it — not just the time block, with every change waiting on the person's approval.

> How it applies to you: your mornings already read calendar and mail apart. One line of mail context on a day like Saturday's gem show would put the why beside the when, in the same form your briefing already uses.

Google Sheets + Google Tasks — numbers answered in plain words, and mail turned into tasks.

What others do: the GetMuseHelp connectors list (no date on the page; read November 10, 2026) gathers this pairing from users: Sheets answers questions about your numbers in plain words, and Tasks turns emails and ideas into an organized to-do list.

> How it applies to you: your cat food sheet and your price comparison sheets already live in Sheets, and your lists already live in Tasks. Asking a sheet a plain question — which buy was cheapest per softgel — is a use of what you already have, at no new cost.

Zoom — a short written summary of the family call.

What others do: the same GetMuseHelp connectors list (read November 10, 2026) names Zoom among the live connectors people use for meeting summaries, upcoming calls, and follow-ups instead of rewatching a recording whole.

> How it applies to you: the Montano family call runs on Zoom every month, over the family photos. A short summary after each call — decisions, who owes what — would stand in your records for the photo work. It would need your Zoom sign-in, approved by you.

Finances (Plaid) — every standing charge on one sheet.

What others do: the GetMuseHelp connectors list (read November 10, 2026) describes Plaid as the road people use for balances, transactions, and weekly spending summaries from linked bank and card accounts — look only, never moving money.

How it applies to you: December holds renewals and the $360-a-year charge due to be cancelled by December 22. One read of every recurring charge would put them on one sheet before those dates. The cost, named plainly: this reads your bank accounts through Plaid — the largest trust step of any connector here — which is why it stands as a proposal only.

OpenTable and Ticketmaster — a table or seats held for your yes.

What others do: the Recipy guide to the consumer apps worth connecting first (September 24, 2026) describes OpenTable bookings as approval-gated — Muse finds and proposes, you confirm — and Ticketmaster as surfacing events, seats, and prices, with the purchase itself finishing on Ticketmaster.

How it applies to you: for an outing around the Holds or a show worth a drive, either road ends at your yes before anything is booked or bought. Neither needs a new store account beyond the service itself, and both stand as proposals only.

Your open questions — this week's research

Question 1, logged November 6, 2026: Samsung Health's held-back numbers — blood pressure, blood oxygen, heart-rate variability, and resting heart rate — do not flow into Health Connect, so they cannot reach Muse. Has anyone in the user community hit this same wall, and if they got past it, what did they do?

What was found this week — the same answer as last week, now standing on one more fresh source. Reddit was tried first and returned no posts that could be read on this problem; Reddit stands named as unread, and nothing here rests on it.

Samsung's own developer page, “Accessing Samsung Health Data through Health Connect” (no date on the page; read November 10, 2026), prints the sync table in full: blood pressure syncs to Health Connect's blood pressure record kind, and blood oxygen syncs to its oxygen saturation record kind, each under its own permission. The table lists no heart-rate variability kind and no resting heart rate kind for Samsung Health.

A fresh app-by-app table, “Health Connect data types, app by app” on the Life Dashboard page (updated November 4, 2026; its tables stand as of October 2026, built from each app's own list of what it writes), says the same thing in plain form: Samsung Health writes blood pressure and oxygen saturation to Health Connect, and does not write heart rate variability or resting heart rate — Samsung keeps those two, with skin temperature, respiratory rate, stress, and its Energy Score, to itself.

Samsung's own US community thread, “Samsung Health Not Writing to Health Connect” (first post November 19, 2025), carries the fix other users report: scroll down in Samsung Health settings to the consents and turn on “Consent to the processing of health and wellness data,” then restart the phone — after that, Samsung Health started writing to Health Connect for them. Samsung's own support page for syncing after the Samsung Health 7.0 update (read November 10, 2026) lists the same consent switches under Privacy as the settings to turn on. The WeightSnap guide to Health Connect syncing (verified on a Samsung device in August 2026) gives the full order: turn on that consent, turn on “Sync with Samsung account” and tap Sync now, restart the phone — and take a fresh reading, because Samsung Health sends entries across as they are created or changed, so an old entry sitting still may never push itself over.

So the split stands, with its sources named: for blood pressure and blood oxygen, a possible answer stands — the kinds do sync, under their own permissions, with the consent switch on. For heart-rate variability and resting heart rate, no answer was found again this week: Samsung's sync table does not list them, and the fresh app-by-app table confirms Samsung Health does not write them, so no step here is claimed for those two.

Proposal — phone steps standing ready, for your Galaxy Z Fold5. The end result first: blood pressure and blood oxygen readings from your watch would stand in Health Connect, where Muse can read them.

1. Open Samsung Health on your phone.
2. Tap the three dots at the top right, then tap Settings.
3. Tap Health Connect, then App permissions, then Samsung Health.
4. Turn on Blood pressure and Blood oxygen — or tap Allow all.
5. Go back to Settings and scroll down to Privacy.
6. Turn on Consent to the processing of health and wellness data.
7. In Settings, tap Sync with Samsung account and switch it on, then tap Sync now.
8. Restart your phone.
9. Open Samsung Health and pull down on its home screen to refresh.

10. Take one fresh blood pressure reading and one fresh blood oxygen reading on your watch, so new entries stand ready to send across.
11. Open Health Connect and look under Vitals for blood pressure and blood oxygen.

    Worth trying here: yes, for the two kinds named — it costs nothing, uses only Samsung Health and Health Connect, which you already have, and can be undone by turning the same switches off. Trying it waits on your word in chat; nothing on your phone was changed by this run. The question's state in its list stands at “possible answer found,” and its note is set to today's date, November 10, 2026 — the question itself is closed only on your word.

The counts

The counts: 15 in use and checked — 12 working well, 0 working poorly, 3 no record this week. Proposals: 1 (the Samsung Health phone-steps proposal above; connector switch proposals: 0). New connectors that fit: 0 (new connectors this week: 1 — Uber Courier, judged little use to you). Ideas from outside kept: 5. Open questions researched: 1. Open questions with a possible answer: 1. Anything this review proposes waits on your word; it changes nothing on its own.
