80 connectors on hand — 10 of them connected

Connectors report

Friday, November 6, 2026 — every connector Muse can use, grouped by kind, with what is new and what fits you.

Connected now: Facebook, GitHub — your key road (custom), Gmail, Google Calendar, Google Contacts, Google Docs, Google Drive, Google Sheets, Google Tasks, vidIQ.

How this report is ranked: by your own use first — the ones you use every day stand at the top of each group — and then by how well each one fits your life. There is no checked review score for connectors, so this report prints none; any ranking word here rests on use and fit, nothing else.

New today

This is the first edition — the first snapshot of the catalog. Nothing counts as new yet; from tomorrow on, this section names any connector that appears in the catalog for the first time.

Fits you

Not connected yet, and their use plainly fits your life:

HealthEx — Gathers your records from your own healthcare providers — conditions, medicines, allergies, lab results and visit notes — into one place you can read before a visit.

Function Health — If your blood work runs through Function Health, this reads the lab results and the doctor's notes on them, with the normal ranges beside each number.

Zoom — Reads Zoom meetings, recordings and written summaries — your family's monthly Montano call runs on Zoom.

Ticketmaster — Finds events and shows which seats are open and what they cost — the kind of looking you do for shows around the Holds. Searching needs no sign-in.

OpenTable — Books a table at restaurants that take OpenTable reservations, with the open times shown first. (a guess)

Canva — Lays out signs, posters and pages from ready-made designs — it could serve the signs and menus you make for Mogollon's Hearth. (a guess)

The full list, by kind

Mail, calendar, contacts and tasks — 11

- **Gmail** — Your own Google mailbox — search, read, draft and send mail. (Connected; used daily.)

Already working for you: your own mailbox — it searches, reads, drafts, and sends your Gmail. It cannot change Gmail settings, filters, or forwarding.

- **Google Calendar** — Your Google calendars — read the agenda and add, change or cancel events. (Connected; used daily.)
  Already working for you: your calendars — it reads your days and adds, changes, and cancels events, like this Saturday's gem show appointment.
- **Google Tasks** — Your Google to-do lists — read and manage tasks and due dates. (Connected; used daily.)
  Already working for you: your to-do lists — it reads and manages your Google Tasks and their due dates.
- **Google Contacts** — Your Google address book — names, email addresses and phone numbers. (Connected; used sometimes.)
  Already working for you: your Google address book — names, email addresses, and phone numbers, looked up and kept straight when mail or meetings need them.
- **Calendly** — Your Calendly booking links and the meetings people book on them. (Available — not connected; not used yet.)
  Little use to you: it manages booking links that other people use to grab time with you — built for a business taking appointments; your calendar is personal and runs through Google Calendar.
- **IMAP Email** — Reads mail from other providers that offer IMAP, such as iCloud Mail. Read-only for now. (Available — not connected; not used yet.)
  Little use to you: it can only read mail from other providers such as iCloud Mail, and it cannot send, file, or draft anything; all your mail runs through Gmail.
- **Muse Mail** — Muse's own mailbox, separate from yours — mail Muse itself sends and receives. (Available — not connected; not used yet.)
  Little use to you: this is Muse's own mailbox, not yours — it exists for Muse's own sending and receiving, and your mail lives in Gmail.
- **Outlook Calendar** — Microsoft calendars, personal or work — read and manage events. (Available — not connected; not used yet.)
  Little use to you: it runs Microsoft calendars; your days live in Google Calendar, and your record shows no Microsoft calendar in use.
- **Outlook Contacts** — Address books of your Microsoft accounts. (Available — not connected; not used yet.)
  Little use to you: it reads address books in Microsoft accounts; your address book is Google Contacts.
- **Outlook Mail** — Microsoft mailboxes, personal or work — read and send Outlook mail. (Available — not connected; not used yet.)
  Little use to you: it reads and sends mail in Microsoft mailboxes; your mail is Gmail, and no Outlook mailbox stands in your record.
- **Todoist** — Todoist to-do lists, projects, labels and reminders. (Available — not connected; not used yet.)
  Little use to you: Todoist is another to-do list app; your lists already live in Google Tasks, so this would split them for no gain.

Files, documents and notes — 11

- **Google Drive** — Your files in Google Drive — find, upload, download, organize and share. (Connected; used daily.)
  Already working for you: your Drive files — it finds, uploads, downloads, and organizes them; your roof shopping list and your policy papers came through here.
- **Google Docs** — Your Google documents, including the notes and notebooks you keep as Docs. (Connected; used sometimes.)
  Already working for you: your Google documents, including the notes and notebooks you keep as Docs — read and edited where they already live.
- **Google Sheets** — Your Google spreadsheets — read and edit cells, tabs and formulas. (Connected; used sometimes.)
  Already working for you: your spreadsheets — the cat food sheet and the price comparisons live here, read and edited in place.
- **Box** — Your Box files and folders, with comments and sharing. (Available — not connected; not used yet.)
  Little use to you: it works with files kept in a Box account, and your files live in Google Drive. A guess: it would matter only if a business ever sent you files through Box.
- **Dropbox** — Your Dropbox files and folders, and file requests from other people. (Available — not connected; not used yet.)
  Little use to you: it reads, moves, and shares files in a Dropbox account; your files live in Google Drive, and nothing in your record shows you keeping a Dropbox.
- **Evernote** — Your Evernote notes, notebooks, tags and attachments. (Available — not connected; not used yet.)
  Little use to you: it works with notes kept in Evernote; your notes and notebooks live in Google Docs and Drive, so this would be a second notebook to keep up.
- **Google Forms** — Build Google Forms surveys and read the answers that come back. (Available — not connected; not used yet.)
  Could help you: build a short form and read the answers in one place. A guess: it earns its place only if you ever want guests or family to answer in writing, say a few questions after a stay at the Hearth.
- **Google Slides** — Your Google Slides presentations — read and edit them. (Available — not connected; not used yet.)
  Little use to you: it reads and edits Google Slides decks; your reports and pages are built as documents and web pages, and your record shows no slide decks to keep.
- **Granola** — Notes, summaries and transcripts of your past meetings, kept by Granola. Read-only. (Available — not connected; not used yet.)
  Little use to you: it only reads notes that the Granola app itself recorded from meetings, and it cannot make new ones; your family call runs on Zoom, and no Granola record stands in your files.
- **Notion** — Your Notion workspace — pages, notes and databases. (Available — not connected; not used yet.)
  Little use to you: Notion is a notes and pages workspace of its own; your notes and notebooks already live in Google Docs and Drive.

- **Readwise** — Your reading highlights and the articles saved in Readwise Reader. (Available — not connected; not used yet.)
  Little use to you: it keeps reading highlights and saved articles inside Readwise and its Reader app; your reading lives in the Scroll, the Feed, and your books, not in Readwise.

Money, shopping and stores — 16

- **Shopping search (Meta Catalog)** — Searches products across many merchants, with prices, pictures and checkout options. (Ready to use — no sign-in needed; used daily.)
  Already working for you: it searches products across many stores with prices and pictures, and no sign-in — it is the search behind your shopping checks.
- **Link by Stripe** — Pays with a card saved in Stripe's Link wallet, after you approve the purchase. (Available — not connected; used sometimes.)
  Already working for you: a wallet that pays a checkout with a one-time card, so the store never sees your real card number — and only after you approve the purchase.
- **Shop Pay** — Pays with a card saved in your Shop Pay wallet, after you approve the purchase. (Available — not connected; used sometimes.)
  Already working for you: a wallet holding your card for checkouts that offer Shop Pay — it pays only after you approve the purchase.
- **Finances (Plaid)** — Reads your linked bank, card, loan and investment accounts — balances, spending and bills. Read-only. (Available — not connected; not used yet.)
  Could help you: read your linked bank, card, loan, and investment accounts in one place — balances, spending, and recurring bills; it can only look, never move money or change an account.
- **Grab** — Grocery delivery through GrabMart and restaurant booking through Grab Dine-out, where Grab serves. (Available — not connected; not used yet.)
  Little use to you: grocery delivery and restaurant booking through Grab, which serves Southeast Asia, not Payson.
- **Gumroad** — Sells digital products and memberships for creators on Gumroad. (Available — not connected; not used yet.)
  Little use to you: it runs a Gumroad shop selling digital goods and memberships; you sell nothing online.
- **Instacart** — Searches groceries and builds a cart at a store you pick; checkout finishes on Instacart. (Available — not connected; not used yet.)
  Could help you: search groceries and build a cart at a store you pick, with the checkout finished on Instacart. A guess: it helps only if delivery to the house beats the Walmart run for you.
- **Kavak** — A used-car marketplace — search cars, compare prices, find showrooms. Information only. (Available — not connected; not used yet.)
  Little use to you: a used-car marketplace in Mexico — it can only show cars, prices, and store policies, it cannot reserve or buy a car, and its lots are not in Arizona.
- **Money Forward ME** — Reads bank, card and securities accounts linked in the Money Forward ME app. Read-only. (Available — not connected; not used yet.)

Little use to you: it only reads accounts linked in Money Forward ME, a Japanese money app; your bank and card accounts are not in it.

- **Printify** — Print-on-demand products made and shipped for your shops. (Available — not connected; not used yet.)
  Little use to you: Printify makes and ships printed goods for shops a merchant runs; you run no shop for it to fill orders for.
- **QuickBooks** — A company's QuickBooks books — reports, customers, invoices and payroll. (Available — not connected; not used yet.)
  Little use to you: QuickBooks keeps a company's books — invoices, customers, and payroll; you are retired and keep no company books.
- **Rappi** — Restaurant finding and cart building on Rappi, first rolled out in Mexico. (Available — not connected; not used yet.)
  Little use to you: restaurant finding and cart building on Rappi, rolled out in Mexico, and it cannot place the order itself; it does not serve Payson.
- **ShopBack** — Cashback offers and cashback-tracked shopping links, plus hotel and flight prices. (Available — not connected; not used yet.)
  Little use to you: cashback offers and cashback-tracked shopping links, mostly at stores outside the United States; you buy at Amazon and Walmart, which this does not cover in your record.
- **Shopify** — Runs a Shopify store of your own — products, inventory, orders and customers. (Available — not connected; not used yet.)
  Little use to you: it runs a Shopify store of your own — products, stock, orders, and customers; you buy from stores, you do not run one.
- **Shopify checkout (UCP)** — Buys eligible Shopify-store products found in shopping search, paid with a wallet. (Available — not connected; not used yet.)
  Could help you: when a product you found in shopping search comes from a Shopify store, this can check it out directly with your wallet after your approval, instead of a trip through that store's own site.
- **Stripe** — Runs payments for your own business — customers, invoices, subscriptions and refunds. (Available — not connected; not used yet.)
  Little use to you: Stripe takes card payments for a business of your own — customers, invoices, and refunds; you run no business that takes payments.

Travel, tickets and going out — 8

- **Places Search** — Finds places and businesses, with addresses, hours, ratings, reviews and photos. (Ready to use — no sign-in needed; used daily.)
  Already working for you: it finds businesses and places around the Holds with hours, ratings, reviews, and photos — the looking behind your roofer and store checks — and it can name a place from a photo.
- **Agoda** — Searches places to stay, flights, tours and attraction tickets on Agoda. (Available — not connected; not used yet.)
  Could help you: price rooms, flights, and tour tickets on Agoda as one more yardstick for a trip; the booking itself finishes on Agoda's own site, not here.

- **Despegar** — Flight search with flexible dates, monthly price trends and destination deals. (Available — not connected; not used yet.)
  Little use to you: it only searches flights, priced for the Mexico market by default, and it cannot book anything; Duffel covers flight searching and booking for your trips.
- **Duffel** — Searches, books and cancels whole flight trips across many airlines. (Available — not connected; not used yet.)
  Could help you: search whole flight trips across many airlines, book and cancel them, and reserve a pay-at-pickup rental car — a road for the next trip that needs a flight, and it needs no login of yours.
- **Expedia** — Searches and prices hotels and lodging on Expedia, and books some rates directly. (Available — not connected; not used yet.)
  Could help you: price hotels by the full stay and book some rates directly — a second price to hold against other sites when a trip needs a room.
- **FlightAware** — Flight schedules, live status, positions and airport activity. (Ready to use — no account to connect; not used yet.)
  Could help you: check a flight's live state — delays, gates, and where the plane is — on a day you or your kids are flying; it needs no account and books nothing.
- **OpenTable** — Reads live restaurant availability and makes, changes or cancels reservations. (Available — not connected; not used yet.)
  Could help you: see a restaurant's open tables live and book, change, or cancel the booking. A guess: it earns its place when a place you want takes OpenTable bookings, which has not come up yet.
- **Ticketmaster** — Finds events and shows the seats still open, with prices. Buying finishes in the browser. (Ready to use — no setup needed to search; not used yet.)
  Could help you: find shows and events and see which seats are still open and what they cost before you commit — the same kind of looking you do for outings around the Holds; buying itself finishes in the browser.

Social, music, video and design — 12

- **Facebook** — Your Facebook — friends, posts, groups, events, saved items and Marketplace. (Connected; used daily.)
  Already working for you: it reads your Facebook — friends, groups, events, saved items, and Marketplace — behind your yard-sale and group checks, and it posts as you only when you say so.
- **vidIQ** — YouTube research — channels, videos, keywords and trends, plus titles, thumbnails and scripts. (Connected; used sometimes.)
  Already working for you: it researches YouTube — channels, videos, keywords, and trends — and drafts titles, thumbnails, and scripts when a video question comes up.
- **Canva** — Makes and edits Canva designs — posters, pages, presentations — and exports them. (Available — not connected; not used yet.)
  Could help you: lay out signs, posters, and pages for Mogollon's Hearth from ready-made designs and export them ready to print. A guess: it earns its place only if you take to designing in Canva rather than the way you make signs now.

- **Figma** — Reads Figma designs and design systems, downloads assets, makes reviewed changes. (Available — not connected; not used yet.)
  Little use to you: it reads and edits designs in Figma, a tool for people who design apps and websites for a living; your pages are already built and published another way.
- **Instagram** — Your Instagram — profiles, posts, stories, saved items, and publishing. (Available — not connected; not used yet.)
  Little use to you: it reads and posts on Instagram; your people and your groups live on Facebook, and your record shows no Instagram life to keep up with.
- **Instagram Messages** — Reads and sends your Instagram direct messages. (Available — not connected; not used yet.)
  Little use to you: it reads and sends Instagram direct messages; your family and friends reach you on Facebook and Messenger instead.
- **Messenger** — Your personal Facebook Messenger — read, search and send messages. (Available — not connected; not used yet.)
  Could help you: read, search, and send in your own Messenger account, including Marketplace threads — the talks that run beside your Facebook rather than inside it.
- **Meta Business Manager (ads)** — Facebook and Instagram advertising — campaigns, spend, audiences and ad policy answers. (Available — not connected; not used yet.)
  Little use to you: it runs and reads Facebook and Instagram advertising — spend, campaigns, and audiences; you do not advertise the Hearth or anything else.
- **Runway** — Generates and edits video, images and audio with Runway, and runs saved workflows. (Available — not connected; not used yet.)
  Could help you: make and edit short video, pictures, and sound from words. A guess: it earns its place only if you want moving pictures for the Hearth beyond the stills your standing work already makes.
- **Spotify** — Search and play Spotify music, audiobooks and podcasts; manage playlists and playback. (Available — not connected; not used yet.)
  Could help you: find and play music, podcasts, and audiobooks on your devices, and keep playlists. A guess: it helps only if you listen through Spotify, which your record does not show.
- **Threads** — Your Threads — profiles, posts, replies, feeds and publishing. (Available — not connected; not used yet.)
  Little use to you: it reads and posts on Threads; your people and your groups live on Facebook, and no Threads life stands in your record.
- **Threads Messages** — Reads and sends your Threads direct messages. (Available — not connected; not used yet.)
  Little use to you: it reads and sends Threads direct messages, a second inbox on a service your record does not show you using.

Health — 6

- **Health Connect** — Your Android health record — steps, heart, sleep and workouts synced from your Samsung phone and watch. (Working — reads from your paired Android phone; used daily.)

Already working for you: it reads the health record your Samsung phone and watch sync — steps, heart, and sleep — the data your health watch rests on. It cannot reach the kinds Samsung still holds back from Health Connect.

- **Apple Health** — Health data from an iPhone — the Apple-side twin of Health Connect. iPhones only. (Available — not connected; not used yet.)
  Little use to you: it reads health data from an iPhone only, and your phone and watch are Samsung — Health Connect already does this job for you.
- **Function Health** — Reads Function Health lab and blood-test results and the doctor's notes on them. (Available — not connected; not used yet.)
  Could help you: read Function Health blood-test results with each number's normal range beside it, plus the doctor's notes on them. A guess: it helps only if your labs run through Function Health, which your record does not yet show.
- **HealthEx** — Gathers your records from your healthcare providers into one read-only place. (Available — not connected; not used yet.)
  Could help you: pull your own records from your healthcare providers — conditions, medicines, allergies, lab results, visits, and the doctors' notes — into one place to read before a visit; it only reads and changes nothing.
- **Peloton** — Searches Peloton's class catalog and manages the classes on your Peloton schedule. (Available — not connected; not used yet.)
  Little use to you: it finds Peloton classes and manages a Peloton class schedule, but it cannot read your finished workouts; your health record runs on your Samsung watch, and no Peloton stands in your record.
- **Withings** — Reads a Withings account — weight, blood pressure, heart, sleep, activity and ECG. (Available — not connected; not used yet.)
  Little use to you: it reads weight, blood pressure, sleep, and heart data from Withings devices; your health record runs on Samsung only, which you settled yourself.

Home, devices and network — 4

- **1Password** — Fills saved logins from your 1Password vault when signing in to websites in Muse's browser. (Available — not connected; not used yet.)
  Could help you: fill a saved login into a website in Muse's browser, without the password ever being shown. A guess: it helps only if you keep your logins in 1Password, which your record does not show.
- **Philips Hue** — Controls Philips Hue lights, rooms and scenes through your Hue bridge. (Available — not connected; not used yet.)
  Could help you: turn Philips Hue lights on and off and set scenes and colors by room, just by asking. A guess: it helps only if the house or the Hearth runs Hue lights, which your record does not show.
- **Tailscale** — Joins this computer to your private Tailscale network to reach your own services. (Available — not connected; not used yet.)
  Little use to you: it would join this computer to a private Tailscale network of your own so it could reach services on it; your record shows no such network running, so there is nothing for it to reach.

- **Tessie (Tesla)** — Reads Tesla vehicle state through Tessie and sends supported car commands. (Available — not connected; not used yet.)
  Little use to you: it reads a Tesla's state and sends it commands through Tessie; your record shows no Tesla — your driving and your tracking run on other gear.

Work and building tools — 12

- **GitHub — your key road (custom)** — Your own GitHub connection — the key road that publishes your sites to GitHub every night. (Connected — your own GitHub key road; used daily.)
  Already working for you: this is your own GitHub key road — it publishes your Scroll, your menu, and your pages to GitHub every night and reads them back to prove they landed.
- **Asana** — A team's projects and tasks — owners, due dates, comments and status. (Available — not connected; not used yet.)
  Little use to you: it runs a team's projects and task boards, with owners and due dates; you have no team handing you work, and your own lists live in Google Tasks.
- **GitHub (the system one)** — GitHub's own connector for repositories, files, issues and pull requests. Your nightly publishing does not use this one. (Available — not connected; not used yet.)
  Little use to you: GitHub's own connector is a second road to the same repositories, and it would need the Muse app installed on each repository before it could touch it; your publishing already runs on your own key road.
- **HighLevel** — A CRM and marketing platform for small businesses — contacts, pipelines, campaigns, invoices. (Available — not connected; not used yet.)
  Little use to you: HighLevel is a customer and marketing system for small businesses — pipelines, campaigns, and invoices; you run no business that chases customers.
- **Klaviyo** — Email and text-message marketing for businesses. (Available — not connected; not used yet.)
  Little use to you: Klaviyo sends marketing mail and texts for businesses — campaigns, lists, and coupons; you have no customers to market to.
- **Linear** — Tracks software issues, projects and work cycles for a team. (Available — not connected; not used yet.)
  Little use to you: Linear tracks software work for a team — issues, projects, and cycles; there is no software team in your life for it to track.
- **Lovable** — Reads, creates, edits and deploys your Lovable app projects. (Available — not connected; not used yet.)
  Little use to you: it builds and hosts small apps inside Lovable; your pages are built here and published to GitHub, so a second building yard would split the work for no gain.
- **Replit** — Finds, creates, updates and publishes your Replit apps. (Available — not connected; not used yet.)
  Little use to you: it builds and publishes apps inside Replit; your pages are built here and published to GitHub, so this would be a second building yard.
- **Slack** — Your Slack work chat — read channels and threads, send messages as you. (Available — not connected; not used yet.)

Little use to you: Slack is a work team chat; there is no work team in your life chatting on it — your people are on Facebook, Messenger, and Zoom.

- **Vercel** — Inspects your Vercel web projects and deployments, and makes reviewed changes. (Available — not connected; not used yet.)
  Little use to you: Vercel hosts web projects for people who build them; your sites publish to GitHub Pages through your own key road.
- **Zapier** — Runs actions across apps you connected in Zapier, including apps with no connector of their own. (Available — not connected; not used yet.)
  Little use to you: it runs actions in other apps through automations you build in Zapier; your nightly work already runs on its own jobs, and a second layer would be one more place for things to break.
- **Zoom** — Your Zoom meetings, recordings, transcripts and summaries, plus Team Chat. (Available — not connected; not used yet.)
  Could help you: read back your Zoom meetings — recordings, transcripts, and written summaries — so the family's monthly Montano call can be caught up on without rewatching it whole; it can also schedule and cancel meetings.
